

Adobe has a check box in the Learning panel that will auto-check if you proceed correctly. This is where things start to get exciting, we have a Logo visible in the Composition panel, items in the Project panel and a timeline for our logo! Clicking on the folder in the Project panel will show us access to vectors of both the Logo Design and the Logo text.

Now that we've imported our logo, we need to open the composition. To edit a composition, it has to be opened the Timeline panel. This is very simply achieved by double clicking the respective Composition in the Project panel which automatically opens it in the Timeline panel as well. 2 items will be visible in Timeline panel now, namely the logo and the logo text of APEAK.

And that's it! We've created a composition!

2) Organising the Composition

In this section, we will learn how to modify compositions and how to add more files to the Timeline panel.

TIP: Double-clicking in the Project panel opens the Import File Dialog box, from where you can easily double-click a file and import it again.

It's important to keep in mind that importing a file does not automatically add it to the timeline. The imported video titled 'Summer_Forest' has to be dragged down into the Timeline panel below the already present logo elements to enable us to play with it.

What's interesting to note is that where we place the video in the timeline, seems to determine which layer is on top. The first in the Timeline panel

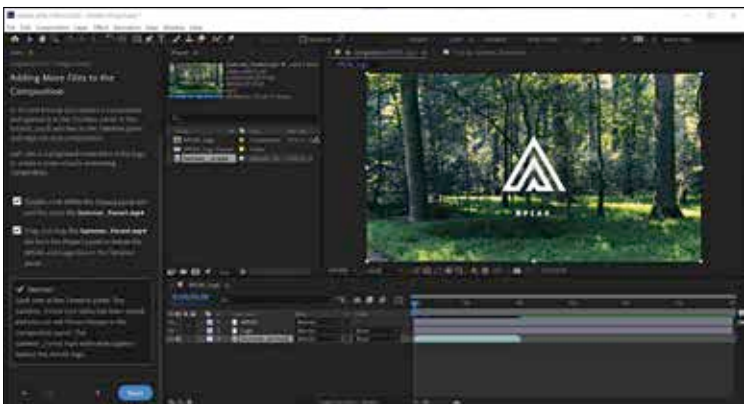

Figure 1: This is the ideal layout for this video, where the order of the layout is APEAK text -> Logo -> Summer_Forest video (highlighted in the Timeline panel)
