

the Timeline panel. Let's learn to maneuver this effect using the Timeline panel for now.

The background is already selected and we need to expand the Effects tab to see the other options including the 'Fast Box Blur' which needs to be further expanded. The 'Blur Radius' property is initially at 0. It needs to be modified to 25. As soon as this is done, the effects are immediately visible in the 'Compositions' panel, the entire forest background is blurred and you can't even make out any of the trees.

The Effect Controls panel opens up once we click on an effect, with a range of customisable options.

The effect is visible from the onset but to give it a bit more pizzazz, we're going to make it appear simultaneously with the logo. The Current Time indicator has to be at the 1 second mark which is when the Logo appears completely with the text. And then you probably guessed it right, time to keyframe! Just click on the stopwatch symbol next to the Blur Radius property.

Move the Current Time Indicator to the start to set when the effect kicks in, set the blur radius to 0 and hit enter. This would've created another keyframe at the start. If you remember the Opacity property of the Logo text which made it fade in, this would achieve a similar effect, only, the background would be fading out. Press the Spacebar to preview the effect we've created and to see how it looks.

Adding more effects that can make the visuals more engaging always help, so let's try adding another effect to see how they play into each other. Click on Effects → Distort → Mirror. Just as before, you can't see the effect
