

If you look at the bottom panel, you will notice that the time bars which have been ever present are no longer visible. That's because the timeline panel has been replaced by the 'Render Queue' panel.

This will initiate the final step which is the actual rendering.

During the final rendering, there are a couple of developments. We can see the preview panel automatically previewing the video as it gets rendered. This doesn't play at normal speed but happens at a few frames at time rate where we can see it's sort of broken.

In the Render Queue panel, we can see the progress of how much has been rendered with a blue bar while at the same time, the actual playback time

Once all the parameters have been adequately defined and the right destination location has been chosen, the file is ready to be rendered, hence the appearance of the 'Render' button in the top right of the Render pane.
