

The next box is the Resolution box where we can use a range of options to either view the properly at high resolution or get a full video preview without focusing on one effect at a faster rate. This is mainly useful because at full resolutions when there are a lot of elements and effects, the preview becomes extremely slow and heavy. So when we want a quick preview, all we need to do is to dial the resolution down a notch or a few and the preview albeit pixelated is really fast and smooth. This is a god send for performance and workflow streamlining purposes.

Then there's the Grids and Guides button. This has a bunch of handy stuff like 'Title/Action safe' which highlights the center and title elements, then there's the 'Proportional grid' which displays huge lines on the preview to help us make the composition better. Then there's the more complex and handy options like 'Grid' which puts a million lines across the composition to gives absolute control over the minutia by pinpointing to a very small area. Finally, there's also the ruler to help us understand where different elements are with respect to the panel, in terms of absolute position.

1. On the top left, you can see the multiple tabs which can get opened if you accidentally double click which leads to a new layer being opened as a tab. 2. Also visible in the preview is all of the buttons in the grids and guides panel toggled on which shows a host of grid lines (visible in green) and rulers on the top and left of the screen.

All of these options have been toggled on and if you don't need them, you'll obviously have to manually toggle them back off.

As a beginner, it is sometimes easy to get lost accidentally and it just so happens that I double clicked in the Composition panel and I got lost. So what happens is, AE creates a separate tab for you with a particular element in that layer and you can use this to inspect something specific closer.
