

Post production

The whole world consumes more video content than any other form of content and with internet penetration showing no signs of plateauing any time soon, this figure is only set to grow. It's also one of the reasons why our FastTrack for the previous month was about editing videos on the mobile. And we've covered professional editing tools such as Premiere Pro in the past.

Now that everyone around you is a content creator, it's high time folks think of upping the production quality. And there are numerous ways that one can improve the production quality of their content. You can improve the quality of the scripts, the kind of shots that you take, the B-Roll footage, the lighting in the scene, the gear that you use, etc. The list goes on. All of the above areas of improvement have to do with the production and pre-production aspects of the content generation pipeline. What folks don't pay much attention to, is the post production aspect. That's the term used to describe the editing process and everything else that happens before the content is finally uploaded for the world to see.

Again, there are numerous ways that you can improve your content during the post production process. You can fine tune the recorded video, slap on simple captions and stickers, use different cosmetic filters, etc. But what do you do when you want to play around with the elements in the video. We're talking about adding or removing individuals from a scene, animating elements and even producing the entire video with nothing but funky effects and dynamic text.

Adobe After Effects is the VFX and Motion Graphics software from the technology giant. It is extremely powerful and serves as a great companion to Premiere Pro. You can use After Effects for keying, tracking compositing and animation. Premiere Pro along with After Effects serve as one of the most popular editing suites used by content creators, TV studios and motion
