

(If you look closely, we have already dealt with some of these in the animating a logo exercise. All of these come under the Transform property of an element. Expanding the collapsible properties under these give us access to these 4 properties).

Experimenting with these 4 properties in synchrony with the time option, will give rise to literally infinite combinations of animations that you can play around with.

A magnified screenshot of the properties that come under the Transform property of an element. Adjacent to these on the right hand side, are their numerical values which can be manipulated to perform various functions to various degrees.

Shapes are represented by a Star symbol next to them in the AE layer description. Setting different values at various time stamps will provide different states of that element – the initial state and the final state. Key framing it this way will provide change on screen. **d**
