

it for us, thereby creating a very smooth ‘transformation’ (hence the ‘Transform’ property) between these 2 states.

- Keyframes can also be used to create closed loops. Marking the point from which an action repeats itself, therefore, essentially looping the video.
- Once we make the first keyframe, there are multiple ways we can add the second keyframe:
 1. You can manually change the properties of an element at a different point of time and hit the Enter key
 2. You can change the values and then press the keyframe symbol on the far right of the same property.
 3. If you want to reuse the exact same effect of a particular property of an element at a later time, then you can also select the keyframe you wish to replicate. Copy it with ‘Ctrl + C’ and then move the active time indicator to the exact time that you want to place this replicated effect. Paste it by hitting ‘Ctrl + V’. This will ensure that you will have the exact same effect at your desired time.

(Mark on the left) This is the keyframe button, you can present the diamond in the centre to create a new keyframe at a different point of time (this can only be done after the first keyframe has already been created)

- The keyframe button in the image above also has an arrow mark on its left and right. This can be used to quickly move between keyframes using your keyboard instead of manually selecting it every time using the mouse.
- The keyframes in the time bar also have a bunch of important differences. The starting keyframe (of a particular property) always starts with a diamond that is half-filled on the right. Similarly, the ending keyframe also ends with a diamond that’s half filled on the left. Any keyframe that is in between these 2 keyframes is a whole diamond without any accentuation.

KEYFRAME EASING

- ‘Keyframe Easing’ adds smooth momentum between points with a
