

Here, I have imported a video of my GoPro footage and dragged it to the top as the first layer. You can see that it has snapped perfectly to the preview panel (move it around until this happens or else you'll have some part of it outside)

Editing the first video or layer is fairly simple. Dragging the cursor over the time bars of the video will change into the resizing cursor. Just drag the front end to the where you want this layer to start and then drag the back end to where you want it to end.

You can follow the same steps for every single layer but there's a more intuitive way to do this using the keyboard shortcuts. First off, you'll have to layer the videos in the order that you want to see them which means that the first video has to be on top, the second video as the second layer and so on. (this ties in with how the timeline panel affects the depth of layers discussed earlier)

On the second video, find a convenient point where you would like the video start and drag the active time bar there (blue vertical line in case you've forgotten). Once you've chosen a point, hold 'Alt + ['. This will highlight the video from that point forth in the time bar and dim the parts before it. To align this with the previous video, hold Shift and drag it so it snaps to the end of the previous video.

If you want the second video to be the same length as the first video, hold Shift and drag it so it snaps to the beginning of the first video. Then, while moving the active time indicator, hold Shift again so it snaps to the end of the first video (you have to drag it to the end of the first video while holding Shift).

Then, you hit 'Alt + [' again which will trim it at that point. You now have two videos of identical length. To ensure the second layer plays in synchrony
