

with the ending of the first video, select the second layer, hold Shift and drag its time bar to the end of the first video. You can check if this is working properly by hitting the Spacebar button and viewing the RAM preview.

NOTE: While RAM previewing my videos, I constantly faced an issue where hitting Spacebar would not play the preview. Instead, the preview would move backwards one frame at a time every time I pressed the Spacebar. There are 2 ways to fix this:

i) Click Edit → Preferences → Audio Hardware.

This will open a dialog box. In the dialog box, there's a Default Output section with a drop-down box. Click on it and select the system default speakers. If that doesn't work, try changing it to another option and then reverting back to the default speaker. (This problem is especially common when you have an external speaker connected to your PC or laptop, even more so when it's a really old model. So, try disconnecting the speakers first and then trying this out). Finally, hit the OK option on the top right of this dialog box.

ii) Click Composition → Preview → Play Current Preview.

This issue fixes the default play mode going to audio which is the other option under Preview.

You can use the same method to import, align and synchronise any number of videos in After Effects where each video will be stored as a layer in the timeline panel.

TIP: If you accidentally, double click one of the video layers, you might notice

In the timeline panel, if you look closely, you can see that the layers (of videos) are of the same length and have been stacked one on top of the other.
