

While moving with the final keyframe, the first keyframe acts as an anchor.

Similarly, while moving the initial keyframe, the final keyframe acts as an anchor.

Apart from changing the duration of animations in After Effects, you can also change the duration of a video or rather, the speed at which it is played. Again, a very easy process.

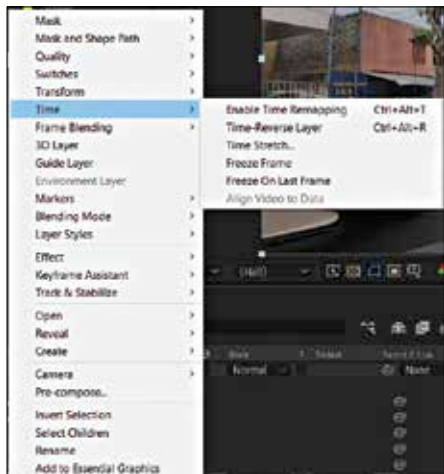

Right click the time bar of the video you want to change the speed of → Time → Time Stretch.

Once this is selected, a dialog box will open. The Time Stretch dialog box.

This box by default opens with a stretch factor of 100 which means that the video is playing at normal speed. As the name suggest 'Stretching' implies how much the video is stretched meaning, the more it is stretched (larger percentages of stretch factors), the longer the video.

Similarly, the lesser it is stretched, the shorter the video and the faster it is played. Once the time indicator is at the end of the bar, pressing N will snap of the unused parts and make the work area less cluttered. The change in lengths of the videos is clearly visible visually via the time bars.

The New Duration bar is very useful if you find this

The direct way to open the Time Stretch is to do it by right clicking the respective time bar and clicking on the Time Stretch option under time.
