

The pre-compose dialog box which will be familiar to readers who have already used apps like Adobe Photoshop where you can group items together

and right click one of these selected elements. From the list of options, choose pre-compose. The Pre-compose dialog box is displayed.

There are a few options present here. The first option is the New Composition name, you can type in an appropriate name here. Next, there are a couple of options, all of which have to be selected and all of which we'll be explaining one by one.

- **Move all attributes into the new composition** – This is a form of linking where let's say you have layers A, B and '3'. These layers are compiled into one composition called 'Comp'. Selecting this option will ensure that 'Comp' is present in the New composition and at the same time, all of its element layers are preserved inside Comp. Comp will not be a stand alone composition if this is selected.
- **Adjust composition duration to the time span of the selected layers** – Makes the new composition of a length that is the length of the longest element ensuring no part gets cut out.
- **Open New Composition** – Opens the composition as a separate layer eliminating all its element layers. Now you have just one stand alone
