

Once the Shape tool is selected, the cursor changes to the target or cross-hair cursor. To draw a rectangle, just click and drag to the desired shape and size of rectangle, then release the mouse button. You now have a Rectangle with your desired Fill colour and Stroke.

Once this is done, you will notice a stray cross-hair in the center of the screen. This is in fact not a stray point at all. It is an 'Anchor' for the shape we have just created. All of the shape's attributes in relation to this Anchor point. Preferably, this anchor point needs to be at the center of the shape so that it's anchored in the its center and not at some external point but this is the default setting and it has to be changed manually. To change the default setting for this:

Click Edit (in the toolbar) → Preferences → General.

This will open the Preferences dialog box.

The dialog box will open with the General tab selected. You need to check the 'Center Anchor Point in New Shape Layers' dialog box. Once this is done, all new shapes once created will have their Anchor Points in their respective centers.

The Preferences dialog box
