

In this row, you will see a numerical value which is the ‘Radius of curvature’ of a corner. You can set this to any value you like and then keyframe it.

There are also a bunch of other features that you can engage with to create highly modified shapes. This can be done by expanding some of

The add features option for a shape and the selected ‘Rounded Corner’ featured in the properties

the properties below the shape. For example, under a Polygon, expand the shape list and you will find a bunch of other properties like ‘Polygon Path’, ‘Stroke’, ‘Fill’ and ‘Transform’, the last of which we have already experimented with quite a bit. Upon expanding ‘Polygon Path’, you will further find a bunch of options like:

- Points (the number of points or corners of the Polygon)
- Position
- Rotation
- Outer Radius
- Outer Roundness

All of these properties can be modified to create truly unique shapes. This will be the same with other Shape builders too, the only difference being that you might find some properties missing and a few other ones present. For example, with the star tool, you will find additional properties like inner radius and inner roundness.

*TIP: Pressing and holding the Ctrl button while making the Star shape can be used to modify the length of the tips once the shape size has been decided. Upon releasing the Ctrl button, you can still resize the shape without releasing the mouse button.*

Once you have created a shape, After Effects remembers it and uses the same basic details when you create a new shape. The Add option under the Contents of a shape, has a useful list of features which are neatly subdivided based on their functions:
