

The timeline panel where the text layer has been duplicated and turned into a shape layer with the visibility toggled on

To do this: Right click the vector (in the timeline panel) → Create → Create Shapes from Vector Layer.

Once you do this, you can see that a secondary layer has been created from the vector and the initial layer has been toggled off. The new layer is a Shape layer, so you can access the parts of the vector individually. This makes it very easy to move parts around, change their colour and scale individually and finally add transition effects that complement each other. **d**
