

have to drag a line out from start to finish. You can do this by simply clicking at the start and end to create a straight line (defined by two anchor points or vertices). To create a zig-zag line, you need only to mark the vertices at the points at which you want the lines to change directions.

You can also create curves with the pen tool. This is done by clicking on the Change Vertex Tool from the Pen drop-down options. Once you do this, just click on the vertex of an already created line and drag. You have a bunch of angle and length possibilities with this option, so bend it to your will. Make sure to deselect the layer if you want to create a new shape in the same composition.

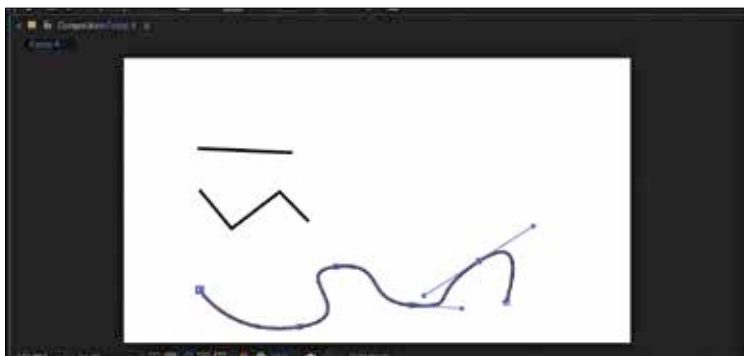

Figure 3: Making different shapes with the Pen tool

*TIP: Press G to activate the pen tool with your keyboard*

Similarly, the pen tool can also be used to modify shapes and add some nuance to otherwise ordinary shapes. You can do this by expanding the contents drop down of a shape in the timeline panel. The drop down the shape name under contents (Rectangle 1 for example, refer image below) Then, right click the shape name path (Rectangle Path 1, refer image below) and click on the 'Convert to Bezier Path' option.

Once this is done, click on the 'Add Vertex tool' from the Pen tool. You can add any number of vertexes to already created images and then modify the shape using the vertex points. You can either drag them to make new shapes or using the Convert Vertex Tool option, you can add some bend to the shape.

Similarly, you can also use the Remove Vertex option of the pen tool to remove a vertex point. If this shape happens to be a Hexagon for example, removing one of the vertexes will convert it into a Pentagon.
