

By right-clicking the encircled object, you can Choose the 'Convert to Bezier Path' to enable the addition and removal of vertex points. This also gives you the freedom to change the curve of the line at vertex points.

Warning: If you do not de-select the layer, you will be left with a variety of objects in the same tool and no freedom to individually modify each element separately. So tread carefully.

FILL AND STROKE EFFECTS

In this section, we'll finally learn to use the Fill and Stroke options which we came across earlier. Once we create a shape, the fill options are in the Tools panels. The Fill Options dialog box opens with 4 main options described in the image here. The Linear gradient creates a gradient linearly in one direction. The Radial Gradient creates a gradient from the center outwards to the edge of the images.

Fill Options Dialog box: 1. No Fill 2. Solid fill 3. Linear Gradient fill 4. Radial Gradient fill

Next to this is the Colour options for filling. You can either Choose a colour or in case of gradients, by clicking below the gradient colour bar, you can add multiple colours and gradients to the mix.

The Stroke options are also identical, the same dialog box opens and you can choose the type of Stroke fill. And a similar set of controls exist for colours and gradients.
