

Once the gradients are applied, you get a line to adjust the range and direction of the gradient for fill and a dotted line for the stroke effects. For some elements like vectors from illustrate and text layers, you will have to choose the property in the layer options to enable it in the tool panel.

Pressing the Plus symbol once next to the properties adds strokes to vector, another press will add a gap, and this can be repeated 3 more times to get 3 sets of strokes and gaps. The values of these strokes and gaps can be modified to lead to some vibrant outputs when combined with colours.

Adding Stroke Effects to vectors and adding multiple strokes

PATH ANIMATION ALONG A PATH

We have learnt how to create custom paths using the pen tool. These same paths can be used to animate different objects in AE. The anchor point of objects plays a particularly significant role in this. For example, if we want a car to turn, then it doesn't make sense for it to turn from the center, the anchor point has to be the front of the car in this case. This can be done by selecting the Pan Behind Anchor Point tool in the Tools panel (dotted box with arrows pushing it outwards). Paths once linked to objects can then be toggled off, so that the path itself doesn't appear in the final output.

Let's assume that a bird is flying in the sky. To link the flight of the bird to the path we made earlier, click on the path properties and expand. Select both 'Path' and 'Path 1' and copy it using 'Ctrl + C'.

Now, expand the properties of the object you want to animate and paste this in the Position property. You will see that the object will move along the path with its anchor.
