

Any effect applied will open the Effect Controls panel on the left

If you look closer in the Effect Controls panel, you will see that there are a whole range of settings that have just opened up. If you collapse all the collapsible lists, you will see that these are actually individual effects that can be toggled on and off by clicking the 'fx' button. And expanding each effect will give you access to a range of properties that you can modify to produce vastly differing results. It's very handy to use effects and presets on compositions as the individual videos themselves do not get altered. There are hundreds of effects and presets, so the Effects and Presets tab has search bar where you can input the name of the effect you want applied. The image presets are particularly simple to use as they are simple effects like producing a sepia tone or a TV display.

TRANSITION PRESETS IN ADOBE AE

Transitions are very specific uses of Presets where we are not going for any specific effect, rather we just want to move in a specific way between layers like images and videos. A transition to once used will have its keyframes and you can choose the duration of transition by either dragging these keyframes in or out. There are also some controls in the Effect Controls panel that you can use to either animate in or out. To reverse the transition, all you need to do is to switch the respective values at the keyframes.

There is an option to preview all the effects and presets in After Effects but to do that you will need to have Adobe Bridge installed. If it is, then you can preview it by pressing the preview option in the top right of the Animations and Effects tab in the Work panel.

TEXT ANIMATION PRESETS

Another specialised use of the presets where text can be animated fun
