

and fulfilling ways that add a punch to the animation. You can animate text manually too but why do all that when it's already done for you right? But if none of the presets seem to be cutting it for you, you can manually animate on your own whims just like how we animated the 2D logo in our first exercise.

## COLOUR CORRECTION IN AE

You can use the Color Correction tab to alter the appearance of your preview in terms of colour. There are a bunch of options to do that like black and white, auto contrast, tint, vibrant, shadow and highlight, etc. Like all other presets, you have the ability to change some values to modify the intensity of the effect. Combining a couple of these will give you some surprising results.

## ADJUSTMENT LAYERS

An adjustment layer is like a lens applied virtually in After Effects. It's still using an effect or preset but it only affects the layers underneath it acting precisely like a lens. So it's position is of paramount importance. They save a lot of effort as we don't have to apply it to each layer individually and at the same time, the original material remains unaltered.

To add an adjustment layer, right click in some empty space in the timeline panel, in the New menu, select 'Adjustment Layer' and that's it, you're good to go. Now any effect or preset that you want to apply to a video, simply drag it from the Work pane and onto the Adjustment layer. In case you don't want to see a particular effect, you can simply toggle it off.
