

- Light (Removes the black and lightens)
- Contrast (enhances contrast)
- Comparative (highlights differences)
- Colour (performs colour transitions)
- Matte (uses one layer as matte)
- Special use

In the bottom left is the icon that you need to toggle to use blending mode and on the right of the screen is the menu of all the different blending modes you can use

Blending modes also depends on the depth of layers and will produce numerous effects based on the layer position. This can be used to do some amazing things like placing a video on a photo, overlaying text over an image and overlaying graphics on videos. To achieve the effect, you desire, you will have to choose an effect from the appropriate mode. Some of the most commonly used modes are Multiply, Lighten and Hard Light. Unlike Effects, these are used in relation between the layers.
