

ment. It is exceptionally easy to use cryptocurrency. All you need is a robust internet connection, a smart device, and it's done.

4. The internet is flooded with flaws. There are over two billion people making online transactions without appropriate rights. However, the cryptocurrency market is clued-in for these people.
5. Neither banks nor the government has any control over the cryptocurrency, which makes you the owner of your own account.

How does cryptocurrency work?

Cryptocurrency is the transfer of digital assets. Unlike the Indian rupees or the US dollar, there is no mainstream authority that manages the value. Instead, the task of managing and maintaining the records is itself distributed among the cryptocurrency users via a chain of the network, which is nearly impossible to break. Satoshi Nakamoto created a digital cryptocurrency popularly known as Bitcoin in 2009, which revolutionised the digital market. Nakamoto described the project as an electronic peer-to-peer cashless system.

Types of cryptocurrency

Did you know Bitcoin was the first-ever blockchain-based cryptocurrency ever introduced? Today, there are more than 5000 cryptocurrencies with different functions and specifications in circulation. The fun part is that Bitcoin, released in 2009, remains the most popular and valuable cryptocurrency ever introduced. As per the recent records, there are over 18.8 million Bitcoins in circulation and the figure is multiplying each day.
