

charges can be anything from maintenance charges, annual fees, convenience fees, and so on.

However, in the case of cryptocurrency, there is no middleman involved, which means these transitions are one-to-one dealings that occur on a peer-to-peer network structure without any outside interference. This means either the transaction fees will be greatly reduced or completely eliminated.

2. More confidential transaction

With all traditional systems, there might be chances that your bank information becomes available to certain third parties when you perform certain transactions. For example, in the United States, when you give your credit card to anyone, they have access to your full credit line. When you make transactions, they are clearly recorded in the history by the bank, which isn't the ideal scenario if you do not want to showcase your transactions.

When a cryptocurrency holder makes a transaction, the software only pushes out the information relevant to that particular transaction. No other information is exposed without the cryptocurrency holder's knowledge, which minimises the chances of fraud.

3. Lower transaction fees for international payments

International payments from traditional cards usually attract a certain fee or charge, which is sometimes even greater than the amount of the commodity. Since cryptocurrency transactions have no intermediary institutions or government to pass through, the amount paid by the user in the same country and the user from the other country remains the same. This feature is especially beneficial to frequent international travellers because now there's no need to travel with lots of cash or stress about the extra charges to be paid on international goods—a win-win situation.

4. Accessible to everyone

Anyone with an internet connection and smart devices can easily send or receive money or cryptocurrency. This feature is exceptionally beneficial for the unbanked members of the society, who do not have access to the traditional banking system but the network to run cryptocurrency and make payments of regular purchases.

5. Easy transaction

With traditional transaction systems, sometimes there are additional charges,
