

Without a doubt, blockchain is the fastest-growing skill in the US freelance job market to the extent that top companies feel that blockchain is capable of replacing existing technologies.

Looking at the surveys and words of leading industrialists, we can conclude that blockchain will be revolutionary in the coming years.

Elements of Blockchain

Blockchain is an emerging technology that provides completely transparent information stored on an immutable ledger accessible only to network members. The key elements of blockchain are:

1. Distributed ledger technology

The blockchain network members can access the record of transactions and the distributed ledger. In this technology, transactions are only recorded once, which minimises the chances of duplication, which is normal in the case of traditional business networks.

2. Immutable records

Once the transaction is recorded in the ledger, there's no way any blockchain participant can tamper with the data or make changes. In case the transaction records an error, a new transaction must be added to reverse and eliminate the error.
