

Types of Blockchain networks

There are various ways to build a blockchain network those are:

- **Public blockchain network**

As the name suggests, the public blockchain network is a peer-to-peer network that anyone can join in the world. The major drawback of the public blockchain network is less security if the user fails to strictly follow the rules, which can highly affect the individual's decision. The most common examples of public blockchain are Litecoin blockchains and Bitcoin.

- **Private blockchain network**

Similar to the public blockchain network, the private blockchain network is a decentralised network that anyone can join at any point in time. However, the network is governed by a well-defined organisation responsible for all the tasks, including the maintenance of the ledger. If compared to the public blockchain network, it is comparatively more secure and confidential, which builds trust among participants.

- **Permissioned blockchain network**

Businesses who decide upon the private blockchain network generally set up a permissioned blockchain network as it imposes restrictions on who will enter your private circle or view transactions. In case anyone wants to enter, they need to take permission to join in. In case the permission is declined, there's no way the person can view records.

- **Consortium blockchains**

Unlike other blockchain networks, it is a semi-decentralised type where multiple organisations manage a blockchain network. In this type of blockchain network, more than one organisation handles all the tasks and exchanges information. This type of network is majorly used by financial institutions, government organisations, and so on.

Typical Blockchain applications aside From Crypto

Blockchain technology has gone beyond cryptocurrency. With its unmatched abilities and benefits, the technology serves endless industries in ways no one ever imagined and enforces various sectors to be more efficient and agile.

Below we have rounded 13 prominent blockchain applications aside from Crypto. Let's have a look-
