

1. Smart Contracts

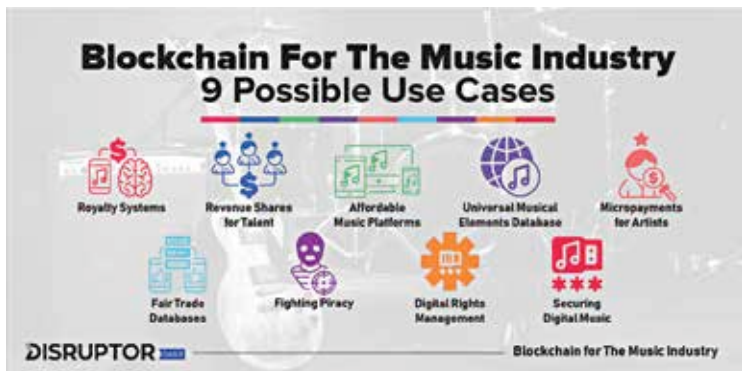

Just like regular contracts, smart contracts that do not contain rules and regulations are enforced on a blockchain, eliminating intermediaries and adding accountability for all the members, which is not possible in traditional agreements. In recent times, blockchain-based contracts are gaining immense popularity in all sectors, including government, real estate, and so on.

- **Healthcare**

Blockchain promotes the easy transfer of files and information about patients to medical professionals. These contracts display all the relevant information along with the details of personalised health plans for every patient.

- **Music**

By using the network, which is decentralised and does not involve third-party, musicians acquire the money they deserve and actually get paid on time. Mediachain is a platform that uses smart contracts to get musicians on board.

2. Personal Identity Security

According to 2017 records, more than 16 million Americans faced identity fraud and theft. By keeping all the important information confidential, including birth certificates, birth dates, social security numbers on the blockchain ledger, there has been a rapid fall in the number of thefts.
