

Introduction

Cryptocurrencies have shown extraordinary resilience in the midst of a global crisis, a pandemic, and an otherwise volatile climate. Furthermore, the pandemic-induced economic crisis aided the business by recruiting not only professional cryptocurrency traders but also resurrecting mining to generate a passive income.

Strong crypto prices are another aspect that has helped to promote mining. Bitcoin (BTC) has increased by about a third, while Ether (ETH), the most popular currency for mining, has increased by \$150, and the decentralised frenzy has resulted in gas prices reaching new heights. So, here's how to build a bitcoin rig.

Mining rigs of various types

Mining rigs, like cryptocurrency wallets, come in three varieties:

CPU: These are relatively basic and low-cost rigs; most people refer to CPU mining as mining cryptocurrencies directly from their computer system. CPU mining has its disadvantages; one of the most important is the cost. CPU mining is both expensive and inconvenient. Take a simple example, your electricity bills will increase, and your machine may overheat at any time if sufficient cooling is not provided.

The biggest advantage of using the CPU method of mining is its accessibility. You may download a few apps to your desktop or laptop and begin mining right now. People who do not want to spend much (or any) money choose CPU mining since it involves little work.
