

CPU

- Any CPU that fits into your motherboard's socket is fine for mining rigs. For instance, for H81 pro BTC, i150 CPU is applicable.
- A better CPU is considered best for 12 or 13 GPU as it will be faster while working on the GPU rigs.
- It is beneficial while changing GPU from graphics to compute mode in AMD settings.
- Get 80+ platinum certified PSU OR 80+ gold only as cheap PSUs can catch on fire that can cause serious damage to the motherboard.

Never try to overload your CPU

Make sure that no more than 2 GPUs are connected to the same SATA cable or PSU Molex. It is very important to keep this in mind, as it can cause a melting down of the PSU. 80 plus helps in telling you how much power the PSU will draw to power up your component.

- The 80 PLUS certificate indicates the amount of additional power that the electricity supply needs to power the components. Let's say that you have 8 GPUs and you are using exactly 1000W on your motherboard and other parts (assuming you have a 50 percent PSU load). 80 + Platinum consumes a total of 1060 W (and loses another 60 W), 80 + Gold consumes 1080 W, 80 + Silver uses 1100 W, 80 + Bronze uses 1120 W, not yet Approved PSU consumes over 1150W. The power consumption of each PC part is the same, but the only change is the additional power that the power supply needs to power the rig (in this example, the PC always uses 1000 W, but the power supply unit requires additional power which will be generated). The maximum efficiency of the power supply is shown in its manual, but in most cases, it is 50-80 percent of the load used in this example. At higher power loads, efficiency drops by an additional 24 percent. Higher quality certificates are expensive and most of them have a 510-year warranty.
- If you're mitigating risk (power supplies are expensive because they've been tested a lot) and you're already spending that amount on mining rigs, it's very important to get the highest quality, high-quality power supplies with a long-term warranty. It makes no sense to save some dollars on a very important component, saving power and improving ROI is more important in the long run.
