

difficult and probably don't work properly on all GPUs (especially not the most important low voltage part).

- It's hard to tell if the GPU is generating a memory error or if it has something to do with the GPU that causes long-term corruption (on Windows, if the GPU is working)
- There are powerful tools such as HWinfo64 that can accurately notify you (if properly or unstable) POWER DRAW-Yes, on Linux GPUs use about 5 percent more power than Windows, and overclock / low voltage settings are the same.
- Hash rate – As mentioned earlier, Linux is inefficient and does not give the same hash rate as Windows.
- For example, the same settings on the GPU would be 28.8 MH / s on Linux and 29 on Windows.
- Linux is less stable than Windows 10.
- If Windows is set up properly, it can run for months without a reboot, but most people don't know that.
- Tools such as the SMOS and EthOS are very expensive.

Overclocking and thunderbolt tools often don't work properly. These Linux-based operating systems can't have the same overclocking / thunderbolt settings as Windows and can crash due to poor driver support (800mV of memory works on most Windows GPUs). You can monitor your rig on Windows in the much same way as SMOS or EthOS.

How do I set up Windows?

If you have downloaded Windows 10 from Microsoft's official website (don't use torrents for this), Windows 10 Pro is almost up to date. Go to the control centre, go to updates and security and then select Windows update.

Windows 4.1 drivers and software download the latest .NET Framework 3.5 offline installer. You need to use Polaris run 1.6 and Overdrive Ntool. Windows 10 comes with a 4. x framework, which doesn't work with Polaris and Overdrive Ntool. You need to install .NET 3.5 manually. Insert the Windows 10 USB stick into your PC (the one you used to install Windows) and set the USB drive as the source for your .NET 3.5 installation.

Here's a guide on how to do it. It's quite easy. Download the latest drivers for motherboards, especially the latest chipset drivers. This is very important.
