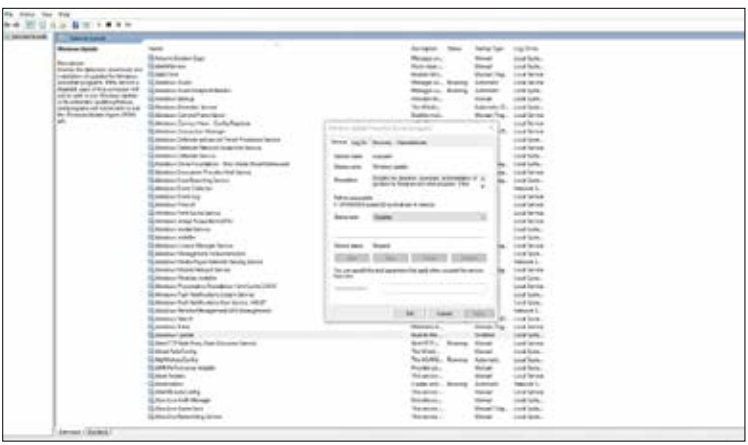
Follow the guide to know how it is done.

- Place the Windows installation DVD in the drive (or if you have the ISO file, right-click on it and Mount). Now have a look at the Drive letter.
- Use the .NET Framework 3.5 Offline Installer to install the framework.
- Select the drive from the media selection drop-down box under the Easy Install option. The application will declare "Found" if it discovers the source. Then press the Install button.
- The progress will be displayed in a CMD console window.
- When the installation is complete, it should shut automatically and display a success message.

Stop Windows Update

- Open RUN and type command "services.msc" to open the service page.
- Check for "Windows Update".
- Check the status. If it is "Checking/Running", turn it off.



- Apply and Restart the system.
- Repeat steps to ensure that it is disabled.

Increase Virtual Memory

- Search for "This PC", then right-click on it and select "Properties".
- Then select "Advanced System Settings".
- Click "Settings" on the "Advanced" page under "Performance".
- Select the "Advanced" tab.
