

Cryptic no more

We've been writing about Blockchain and cryptocurrencies for close to a decade now. Back then Blockchain was primarily used by cryptocurrencies and its applications as a generic ledger technology was only being explored.

After that came the first crypto craze followed by a period of lull. During the second crypto craze, the cryptocurrencies went bonkers alright, but along with that numerous startups began incorporating blockchain technology. At least, in the name. After close to a decade of mainstream unacceptance, cryptocurrencies have finally arrived. Several governments have taken cognizance of the threat that a decentralised currency poses to traditional FIAT currencies and have outright banned cryptocurrencies. On the other hand, we've seen nations accept cryptocurrency as a legitimate tender and have introduced laws to ensure that cryptocurrencies are treated in, more or less, the same way as normal currencies.

No matter how you look at it, cryptocurrencies have become mainstream and it seems like they're here to stay. Over the last year itself, we've seen multiple surges in popularity and over time, the time gap between subsequent surges has been getting lesser. That goes on to show how the retail investors have started pouring money into cryptocurrencies and every Tom, Dick and Harry wants to figure out how to invest in crypto. To a large part, the process is quite similar to stocks but then again, very few people understand the stock market. So, for folks like us, we need a guide to help us enter the world of cryptocurrencies.
