

that the greater the memory quality, the higher the hashrate you may get.

All of these four types are mentioned with their distinctions:

Hynix and Samsung Graphic cards –

All RX 580 8 GB cards

Most of RX 570 8 GB cards

Elpida Graphic cards –

Most of RX 580 4 GB cards

Most of RX 570 4 GB cards

Micron Graphic cards –

RX 570 8 GB cards (rarest types)

GPU Miner

You can now go on to the most essential stage, the mining software, after all of your GPUs have been flashed with the correct modified BIOS. Depending on the algorithm used, there are a few different popular mining programs.

The most prominent include:

- Ethash
- CryptoNight
- EquiHash

Phoenix Miner

Phoenix Miner is presently the top Ethereum miner. It has the possibility of dual mining with various other cryptocurrencies that may increase your earnings by 20-30 percent for a 20 percent increase in power consumption. Even if your electricity is expensive, the extra earnings are likely to be worthwhile.

A developer fee is included in all miner software, which means your miner mines for the developer for a few seconds per hour as a charge.

Overclock/Undervolt

It's critical that you master the art of overclocking and undervolting so that you can get the most out of your GPU.

- Delete all overclocking software you've installed, particularly MSI Afterburner, since it might interfere with appropriate overclocking and undervolting.
- If you were using such commands previously (-cclock, -mclock, -cvddc, -mvddc), as well as -tt and any other option, remove them from the Claymore "start.bat" file. Claymore's overclocking and under-
