

How Ethereum mining differs from other crypto mining?

Even though the Ethereum blockchain is based on Bitcoin's discoveries and ideals, its creators did not just clone Bitcoin's technology but instead made numerous fundamental changes to better suit Ethereum's purpose. This affects Ethereum's mining process as well.

Ethereum was purposely constructed so that it can only be mined efficiently using graphics processing units or GPUs. This is in stark contrast to Bitcoin, which is now almost entirely mined with specialised technology known as ASICs.

Ethereum developers intended to ensure that mining will still be achievable for individuals with home-owned computers and rigs even after substantial network growth and an increased difficulty rate by optimising mining for GPUs.

Profitability calculators in cryptocurrency mining

While deciding which cryptocurrency to mine, it is critical to analyse the profitability of each cryptocurrency using a mining profitability calculator. The procedures listed below will assist you in easily locating the best coin to mine by letting you compare with the profitability calculator:

- You may monitor the rate of each GPU, CPU, or ASIC chip after entering the total hashing power of your mining rigs. You can compare them all on the non-specialised hardware comparison.
