

This chapter gives you an in-depth view of what exactly cryptocurrency is and how it works. So, without wasting any further time, let's dive into our very first chapter about Cryptocurrency.

What is cryptocurrency?

Cryptocurrency is a decentralised digital money based upon blockchain technology, a powerful medium of exchange secured by cryptography. It is a unique technology that prevents counterfeit or double-spend. A significant feature that differentiates cryptocurrency from other currencies of the world is that it is not issued by any central authority. Also, it is immune to government interference.

Since human existence on the planet, currency has played a significant role in our lives. In the beginning, the barter system prevailed, but it fell out of use

because it had some glaring flaws. In 110 BC, an official currency was minted, while in 1250 AD, florins came into use across Europe. Paper currency gained popularity from 1600 AD to 1900 AD.

In today's era, modern currency, including paper currency, coins, debit cards, Apple pay, Paytm, and so on, are in trend, which is controlled by financial bodies. During such transactions, there are several ways where such an exchange of money can go wrong. For example, if there's any technical issue at the bank or the servers are down, there is a central point of failure, which could
