

internet means that there is a higher chance of people falling prey to all sorts of cyber-crimes and malicious activities, which could cause them to be stripped off of their data and valuable information.

People are sparking a change

As the internet increases its grip and reach in the global population, people are also becoming more and more aware of data and information protection and similar activities. Things like clearing caches and cookies, making more sensible and calculated decisions while navigating through the internet, have been on the rise. But there always remains some scope for improvement, as there still remains a significant chunk of the population that is not fully protected or at least armed at the basic levels to combat acts of data and information theft. This is a growing concern all over the world, and both government and private agencies have been taking steps to educate people about how a small step from the people can be a large leap for the internet to be a safer place as a whole. **d**
