

The numbers increased as time progressed, and by August 2020, there was a 7 per cent reported rise in the number of respondents who believed that there was a significant jump in the number of identity theft cases. Not only this, 43 per cent of respondents suggested that there was a significant increase expected to come in the next 12 months. And we are aware of how bad things can get when people are able to pretend to be someone else in the eyes of all kinds of service providers.

Another survey suggested that, on average, in all the markets all over the world, 34 per cent of the adults believed that it was likely that their online accounts would be hacked into in 2021. This percentage saw a dip in India, where a total of 33 per cent responded in favour of the statement that it was likely that their accounts could be hacked into. But, considering the population of the country, which is greater than some of the countries that were represented in the survey combined, it is a thing to worry about genuinely.

Things can get ugly quickly

It is not only identity theft that is on the rise, but there is also a growing concern among the adult population that tech companies have too much control over their data. On an average, 66 per cent of adult respondents in a survey, when asked the question, 'Please state your level of agreement with the following: 'When it comes to my data, I feel like tech companies have
