

is just a search away. So, the thieves who are on the internet looking out for such information, and as soon as they see that someone posted that they are on their vacation with their family, they skim the information on their social media handle, and if by chance they are already aware of or get to know the address of the person whose post they had viewed, they get in action. The next thing you know that people return to their homes only to see it robbed off of all their personal belongings.

Financial Frauds

Financial frauds are not a new thing and have been going on rampantly ever since the internet and telephone banking became a thing. Scammers have been at it, and people to date, despite the best efforts from the government and private agencies, fall prey to financial frauds, where they potentially end up losing thousands or even lakhs of their hard-earned money. And the way that these scamsters work, and the pace at which they disperse the money that they stole, makes it even harder for people and the authorities to get back the money that had initially been stolen.

The way that the scammers get data to carry out these frauds can range from huge data breaches that expose the data of consumers that was stored in any corporation's database, to scam emails that lead people to websites that impersonate the legitimate website, tricking the visitors into believing that they are on a legitimate website and entering their data, which eventually lands up in the hands of people with all sorts of malicious intents.

Third-party sale and exchange of data

There are several services that have been known to collect data and then share it with other corporations and individuals, sometimes even in exchange of money. This involves some of the biggest names of the industry, including corporations like Amazon and Facebook. As
