

chological profiling was done and you were, for the lack of a better word, tricked into making a decision which you otherwise would not have taken.

This is what was done in this case. People's Facebook data, their usage patterns and likes and dislikes were used to make a digital psychological profile, and in turn they were used to push narratives, catered to the stream of thought of the users. All of this was done without anyone knowing. Mind you, the number of profiles affected was reported to be close to 5 million. It wasn't until investigative agencies and media outlets stepped in, that the people were made aware of how their data was being used.

If an organization as large as Facebook can be involved in such a series of incidents, then think what the much smaller organizations, whose applications or services you sign up for, clicking the user agreement without even reading a word of it could do. They literally have nothing to lose, and most of them even don't deliver on the promise that they made, when they onboarded you. We are not saying that you should trust no one on the internet and every app is bad. The only thing that you should keep in mind is that things can go south very fast, and you wouldn't even realise. So, tread carefully.
