Use a password manager

Sticking to the topic of passwords, another thing that is key to protecting or rather making sure that your passwords are safe and stored under the watch of the best security systems in the consumer market is the use of password managers. What they do is, encrypt your passwords and assign a key to decrypt that can be only accessed through the master password that you have set for your account, with the password manager provider.

Almost all the good password managers also have the facility to provide you with passwords that are randomly generated using the 'Password Math'. It is a formula, which can be used by individuals to make sure that their passwords, to a certain extent are unique and unpredictable. Another way to make sure your password does not make sense. You can literally put together phrases in gibberish as your password, as long as you can remember it. This is a trick that many use to make sure that their passwords are practically impossible to guess, even by doing the deepest of research, which can go the extent of even knowing

Keep the passwords organised and hidden
