

self, identify the piece of information, and prompt the company to take appropriate action on it.

Never share your login credentials

Sharing login credentials can be a very risky thing to do. You might trust the person whom you are giving your credentials to, but there is no way to know how secure their connections and measures of protection are. They might not intend to leak your information, but if they slack off in any way and your information gets leaked on to the internet or falls into the wrong hands, you will be one facing the consequences. If someone asks you for credentials, manually enter your credentials into their system and make sure they log out after the work is done. That is your best bet to make sure that no information is lost.

Use DuckDuck Go

You may not realise, but your search engine, no matter what you use, is the biggest outlet for data from your computer system. Switching to a private search engine like DuckDuck Go can make sure that your search patterns and history are instantly deleted after every browsing session and not siphoned off to a storage facility for later examination.
