

1. Audience and Tagging

Under this section, you will find the option to protect your Tweets. When turned on, this will limit the category of people who can see your Tweets. Then another option is there right there called Photo Tagging which lets you control which category of people can tag you in pictures on the platform.

2. Ads Preferences

Here, the personalised ads setting is what you have to change, if needed. Personalised ads when turned on, heighten the tracking activity of the content on your profile and activities that you do on Twitter. So, make sure that it is turned off. In this section itself, you can change your interests and list of advertisers, which would be zero, if you have turned off personalised ads.

3. Data sharing with business partners

As defined by Twitter, 'Twitter always shares information with business partners as a way to run and improve its products. When enabled, this allows Twitter to share additional information with those partners to help support running Twitter's business, including making Twitter's marketing activities on other sites and apps more relevant for you.' We recommended turning it off, if it already isn't.

4. Location Information

You do not want Twitter to know where you travelled on your last vacation? Turn the Personalise the places you've been setting off and they won't know. When in this section of the settings menu, you can also see the recorded information that Twitter has about your location history.

Instagram

Instagram these days knows more about people than their families possibly ever would. Instagram, owned by Facebook, allows users to see what information is known to the platform, and lets the users download the information that the platform has on record, in relation to their account. You can head over to the following link <https://dgit.in/InstaPrivacy> and select the action you want to take. The data download option is self-explanatorily labelled as 'Data Download', and the Account Data option is where you will find all the recorded activity that Instagram has.
