

The surfing speeds might drop down considerably

Any action on the internet requires bandwidth, and so does this deconstruction and encryption of data, when it is processed through a VPN. So, for lower bandwidth and speed connection users, it might be a big hindrance in their workflow, as the loading speeds are known to get severely affected in some low-cost VPN solutions.

Alas, she could not tolerate the slower speeds

You are not in 100 per cent control of your data

Whenever you are using a VPN, you are basically giving it to a 3rd party to process and transfer. This is just like giving an open envelope to someone to deliver to an address. The chances of the VPN providers decrypting your data are quite low. But, in case anything happens, you should be mentally prepared. Read the fine print as we have maintained all this while.

While installing and using a VPN service, always ensure to read into the ways in which the VPN provider might take and use your data. One way to get past all this hassle is to use a popular and reputed service, like Express VPN, Surfshark and Nord VPN. And remember, nothing is free in this world. It all comes at a cost which you have to pay in one form or the other.
