

by the parent or the teacher to make sure that it has been properly done and there is no chance of the data on the device or the ones connected to them being lost to a storage facility in some corner of the world.

7. Personal information is an asset

As we have mentioned in the earlier sections of the book that personal information in today's day and age is just like a literal asset for people. This is a virtue that needs to be engrained in the brains of these up-and-coming internet users. By using a combination of storytelling and real-world examples, like their own social media accounts, if appropriate, parents and teachers can teach the younger ones, the value that they should attach to their information. It should be taught to them that their information is priceless, and should never fall out of their ownership, no matter who asks for it. If the needs be, they must consult an adult before sharing information online, but never take any step on their own.

It's not only the kids

While we used kids and the younger generations to represent the population that is new to the internet, who should be taught these basic values, there is another section of adults and the generation above us, that might also be taking their first steps in the world of internet, where information is money and every man is on their own, and should be taught about these basic rules or virtues to practice when using the internet.

The pandemic has forced many of the older people to shift to online mode of work and conducting vital business, like bank transactions. So, a whole new generation, which had minimal exposure to the internet till now is coming online and it should be your duty, as a seasoned user of the internet to make sure that they are safe. Lesser educated sections of the society, for whom the concept of the internet is a new thing, like our house helps, should also be educated, to make sure that internet is a safe place for them to go to, if the need ever comes. Because no matter the age or experience, anyone new on the internet is as easy a target for adversaries for all kinds of malicious acts.
