

The other thing that needs close attention while you are browsing through the sea of listings of privacy screen protectors online, is the orientation in which they are effective in. Yes, it is a thing. There are again two types here, two-way and four-way screen protectors. Two-way privacy screen protectors work by blocking light from leaking out of your screen in only portrait mode, while the four-way protectors block light in both landscape and portrait mode.

Rest is all up to you. At the end of the day, each user has their own preference, like for some, these protectors would give them peace of mind, while for others, it would ward off the unnecessary eyeballs that inevitably fall on to your screens, while in public.

Don't have the brightest screen

Yes, you read it correctly. This is not only a battery saving tip, but also a way in which you can prevent yourself from falling prey to visual hacking, while waiting for your privacy screen protector or if you chose not to buy it. It is simple. Just lower your brightness to zero or to a level where you can barely read and see the text on your screen. While this may not be the most effective of solutions out there, it still works well enough.

What happens here is that the amount of light emitted from your screen is so low that enough of it does not reach the eyes of the person to enable them to clearly see what is there on your screen. They will have to be dead on, to receive enough light from your screen to see clearly what is being displayed on your screen. And, when this happens, that strong stinging stare from you, as you see them peeping into your screen, would be enough to ward them off.

Turn off your lock screen notifications

Another very effective way to make sure that the keen-eyed ones around you do not get to see what is up in your digital life, is by turning off lock screen notifications. More often than not, notifications from messaging apps especially tend to give out more information that you would ever want to.

Of the ATMs and the skimming

Card skimming frauds as they are called are something that have become increasingly common these days, apart from the usual online attacks that we have talked about earlier in the book. How this works is that using devices like skimmers installed at ATM machine card slots, artificial keypads and
