

There were some who did not know how to shift their workflows online in an effective manner. Hence, it was data heist galore all through the lockdown, all over the world. As more and more people, even after the lockdown continue to work off of remote locations, trying to avoid crowded a somewhat cramped office spaces, and events continue to be hosted online, there a few things that are worthy to be noted and, in this chapter, we would be shedding some light on those.

The threat is real

In Chapter 2, we already showed you the numbers, and there have been enough victims of online data thefts and frauds that it is time for us to make sure that working from home is a safe affair for everyone. There was a whole new sea of people who treaded on the treacherous road of the internet for the very first time, when things went online, and they did not fare well.

Even the experienced ones, caught up in all the things that were developing around them missed out on the finer details and fell prey to the moves of the attackers. So, if you are the one, who thinks that you have everything locked down, we would still want you to read along, and do a thorough run through of all the measures you have in place. Because no one knows which crack will sink the ship.

The risks

Familial data leak

If you are the one who has to turn on your camera for every meeting or event you attend, this is the section for you. You may not realise but a simple look at your background, could reveal a lot. There have been several cases where people have had their familial information leaked, because someone from their family walked past, when they should not have. When someone is out hunting for your information, every bit helps, and showing the faces of the members of your family is not a good thing to do, especially when you are at a public event.

This is where the virtual backgrounds and greenscreens come in. Both these solutions are effective in letting the users hide their location information and background. The way they work is that they change the way your background looks by using various computation techniques and applying a picture as your background whenever you turn your camera on.
