

Never let them see behind your back

Virtual backgrounds, as some apps call it, is a feature that lets users apply any picture as their background, without the use of any special hardware like a greenscreen. You can choose to be on a beach, in a fancy American penthouse or amongst the stars. When used without a greenscreen setup, it fails to capture the person in focus and the edge detection works in strange ways, hiding portions of your image, which the person otherwise would have wanted to show. Greenscreens give another level of crispness and believability to the virtual background, by using the screen to provide crisper edges and depth to the background that is being applied.

How to setup a virtual background:

(The following steps were written with reference to a MacOS system running the latest updates of the apps on MacOS Big Sur. Your settings layout may vary slightly with a Windows machine)
