

which are then open to a thousand different ways of use by the owner. And it is not wrong to say that information in this day and age has become as valuable as literal money on the internet. With enough data about a group of people, one can change things such as the outcomes of national elections. Or, if someone has sensitive information about someone else, they can extort all sorts of benefits from them, and it is not something that we rarely see. The cases of identity theft are on the rise, and decreasing levels of privacy are a concern.

A quote by an Indian standup artist, Punit Pania, “Dance like no one is watching. Text like the whole world is” describes the world that we live in in the best way. Anything that you say to anyone is at risk of being stolen. Internet technology that is touted to be one of the safest mediums of information propagation is actually one of the riskiest places to exchange information. It is not all doomed for the common folks, though. As many of you reading this would already know, certain things and steps can be taken to protect yourself and your online identity, including all the information. But, before we move on, telling you about the steps and the ways in which you and your information is at risk, there are a few things that we need to define and lay as the foundations

It does not have any standardised meaning but yet is important
