

4. OS Licenses:

While it is easy to remove that activate windows watermark, using one of the several guides on the internet, using a free copy of Windows, is something that you would not want to be doing. There are several important security related updates that Microsoft releases for its users, which might put your computer at risk and also make it perform worse over time, because only critical updates are available to users of unactivated Windows.

No one in history has respected a person with unactivated Windows

5. IoT Devices:

The markets these days are flooded with a myriad of cheaper solutions from reputable devices, which lack a lot in terms of their security and safety features. It is better to shell out a few bucks extra to buy IoT products from reputable brands, because they are equipped with the necessary measures to make sure that your data is not at risk.

Beware of the evil twin

There are more than one ways in which your home or workplace Wi-Fi network could be at a high risk. One of the most common attacks on Wi-Fi networks is called evil twinning. In this type of an attack, the lack of our ability to distinguish between two Wi-Fi networks with the same SSID is the thing that is exploited. An attacker selects a location and creates a Wi-Fi network with the same network SSID as that of an already active network in the area. Details such as the encryption type is also maintained to make sure that it is as hard as ever to distinguish this bogus network from the legitimate one. The users end up on the rigged network frequency.
