

It was developed in the 1970s due to the ineffectiveness of the text-based command system that prevailed in earlier times. Xerox Palo Alto Research Laboratory developed it.

Soon enough, it gained a lot of popularity, enabling users to access or enable any option or menu of their choice by clicking on scroll bars, menu bars and browsing windows. They were more visually appealing and made more sense to each user. The Graphical User Interface (GUI) also has voice commands and touch screen facilities with recent developments.

Presence of customisation

We discussed the main pointers that make desktop environments compelling enough for you. One of the most important features includes the freedom to choose and customise your style.

To elaborate further, it means you can create a desktop environment of your own that suits your style and matches your vibe. Officially, about 12-13 desktop environments are present on Linux for you to choose from. The wide variety of options may vary from minimalist to colourful eye-catching designs. However, you will not find them all up to your taste.

With a little technical expertise, you can add, mix or customise a desktop environment of your own. This way, you'll have an environment that is made exclusively for you. It is one of the many reasons people prefer using
