

If you wish to understand how it works on Ubuntu's login screen, you need to:

- Click on the icon present next to your user name.
- The login screen is known as the Display Manager.
- This icon next to your username is specifically designed for users who have more than one desktop environment installed on their desktop.
- If that's not the case, the icon may fail to appear.
- After you click on the icon, a list of pre-installed desktop environments will be seen.
- Select the one you want to apply for.
- Now, set it as your default desktop environment.
- When you sign in again, you'll see your selected desktop environment.

If you want to switch between the desktop environments again, log out and sign in again. Follow the steps mentioned above, and you're good to go.

How to uninstall the desktop environment?

There are times when you may regret the desktop environment that you've installed as it fails to work for you at all. In such a case, the best option is to uninstall the desktop environment. They can take up additional storage space on your desktop and slow it for no reason.

The steps involved in uninstalling a desktop environment are:

1. Go to the page where you searched for the desktop environment.
2. Search for the desktop environment that you installed earlier.
3. Now, click on the uninstall option to remove it from your desktop.
4. In case you're using Ubuntu, this can be done via the Ubuntu Software Centre. It will provide an option to uninstall the desktop environment you no longer need.

If you want to do it by using the terminal, then:

- Run the command: `sudo apt-get autoremove`.
- This will remove all the additional packages that were installed with the desktop environments.
- This way, you can get rid of all the residue of a package you no longer need.
- After running the command and removing the additional residues, error messages can pop up.
- You can avoid the same by signing off immediately.

Sometimes running this command is not necessary as the residue of the desktop environment is removed automatically. However, it's safe always to run the command and remove it voluntarily from your end.
