

This is how a typical KDE desktop environment looks like.

Conclusion

Desktop Environments form an integral part of the working of the Linux operating system. Since it forms the backbone of the graphical user interface (GUI) that you interact with, it must have all the things you like working on or exploring.

Visuals affect our psyche more than words or sounds alone. That's why the visuals or graphics that form the basis of the Linux OS are dependent on the applied desktop environment. Everything depends on the desktop environment you've chosen for yourself, from the menu bar to the icons and title bar.

The Linux operating system has many options for your desktop environment, such as those you can find in the name or key terms of the desktop environment. You can also switch between the desktop environments you've already installed, even if you no longer need them. The wide variety of options makes it different from the other operating systems. **d**
